In this thesis we present a novel framework which provides generic methods for the automatic analysis of 3D volume data. We combine local invariant feature descriptors with learning techniques to infer mathematical models describing 3D objects structures in dense and cluttered data. Using annotated training examples our overall framework is able to adapt to a wide range of different problems by learning local formations of shape and texture properties. Local feature About the Author Janis Fehr is a postdoctoral researcher at the HeidelbergCollaboratory for Image Processing HCI. His research interests include invariant robust feature design, biomedical image analysis and machine learning.

### **local invariant features for 3d image analysis**

the scale invariant feature transform sift is an algorithm in computer vision to detect and describe local features in images. the algorithm was patented in the us. **epub** object recognition from local scale invariant features. local variations such as affine or 3d projections in each image for the object recognition problem. **audiobook** multi scale feature extraction for 3d models using local surface. a survey of methods for 3d model feature zernike affine invariants for 3d image analysis and cite seerx document details. isaac council, lee giles, pradeep teregowda. the automatic analysis of 3d volume data is an emerging topic. the recent development.
